10°

What is claimed is:

1 1. A scanning	aevice	comprising:

an engaging recess defined between two ridges on two sides of a body of the scanning
device, the engaging recess including an open end and a close end in which a connection port
is defined which is adapted to be connected to a PDA:

a scanner received in one of the two ridges and a scanning window defined in an outside of the scanner, an active shaft connected to a side of the scanner and a first gear wheel connected to an end of the active shaft, the first gear wheel located at outside of the body of the scanning device, a second gear wheel connected to the other side of the scanner and located at outside of the body of the scanning device, a transmission assembly engaged with the first gear wheel and the second gear wheel; and

an optical sensing assembly co-rotatably engaged with the transmission assembly.

- 2. The device as claimed in claim 1, wherein the transmission assembly includes a first gear and a second gear respectively engaged with the first gear wheel and the second gear wheel, a pinion located between the first gear and the second gear and engaged with the first gear and the second gear, the pinion co-axially connected to a third gear which is engaged with a shaft of the optical mask.
- 3. The device as claimed in claim 1, wherein the optical sensing assembly includes an optical mask and an optical receiving member which is located at a position from which a gap is defined between the optical mask and the optical receiving member.
